

# **TLR2 Polyclonal Antibody**

Rabbit Anti Human Polyclonal Antibody Catalog # ABV11721

# **Product Information**

| Application       | WB, IHC-P, FC |
|-------------------|---------------|
| Primary Accession | <u>O60603</u> |
| Reactivity        | Human         |
| Host              | Rabbit        |
| Clonality         | Polyclonal    |
| Isotype           | Rabbit IgG    |
| Calculated MW     | 89838         |
|                   |               |

# **Additional Information**

| Gene ID                                                | 7097                                                                                                                                              |

| Positive Control<br>Application & Usage<br>Other Names | WB, IHC-P, FC<br>WB~~1:1000, IHC-P~~1:10~50, FC~~1:10~5<br>Toll-like receptor 2, Toll/interleukin-1 receptor-like protein 4, CD282, TLR2,<br>TIL4 |
| Target/Specificity                                     | TLR2                                                                                                                                              |
| Antibody Form                                          | Liquid                                                                                                                                            |
| Appearance                                             | Colorless liquid                                                                                                                                  |
| Formulation                                            | PBS with 0.09% (W/V) sodium azide.                                                                                                                |
| Handling                                               | The antibody solution should be gently mixed before use.                                                                                          |
| Reconstitution & Storage                               | -20 °C                                                                                                                                            |
| Background Descriptions<br>Precautions                 | TLR2 Polyclonal Antibody is for research use only and not for use in diagnostic or therapeutic procedures.                                        |

#### **Protein Information**

| Name     | TLR2 ( <u>HGNC:11848</u> )                                                                                                                          |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Synonyms | TIL4                                                                                                                                                |
| Function | Cooperates with LY96 to mediate the innate immune response to bacterial lipoproteins and other microbial cell wall components. Cooperates with TLR1 |

|                   | or TLR6 to mediate the innate immune response to bacterial lipoproteins or<br>lipopeptides (PubMed: <u>17889651</u> , PubMed: <u>21078852</u> ). Acts via MYD88 and<br>TRAF6, leading to NF-kappa-B activation, cytokine secretion and the<br>inflammatory response. May also activate immune cells and promote<br>apoptosis in response to the lipid moiety of lipoproteins (PubMed: <u>10426995</u> ,<br>PubMed: <u>10426996</u> ). Recognizes mycoplasmal macrophage-activating<br>lipopeptide-2kD (MALP-2), soluble tuberculosis factor (STF), phenol-soluble<br>modulin (PSM) and B.burgdorferi outer surface protein A lipoprotein (OspA-L)<br>cooperatively with TLR6 (PubMed: <u>11441107</u> ). Stimulation of monocytes in<br>vitro with M.tuberculosis PstS1 induces p38 MAPK and ERK1/2 activation<br>primarily via this receptor, but also partially via TLR4 (PubMed: <u>16622205</u> ).<br>MAPK activation in response to bacterial peptidoglycan also occurs via this<br>receptor (PubMed: <u>16622205</u> ). Acts as a receptor for M.tuberculosis<br>lipoproteins LprA, LprG, LpqH and PstS1, some lipoproteins are dependent on<br>other coreceptors (TLR1, CD14 and/or CD36); the lipoproteins act as agonists<br>to modulate antigen presenting cell functions in response to the pathogen<br>(PubMed: <u>19362712</u> ). M.tuberculosis HSP70 (dnaK) but not HSP65 (groEL-2)<br>acts via this protein to stimulate NF-kapa-B expression (PubMed: <u>15809303</u> ).<br>Recognizes M.tuberculosis major T-antigen EsxA (ESAT-6) which inhibits<br>downstream MYD88-dependent signaling (shown in mouse) (By similarity).<br>Forms activation clusters composed of several receptors depending on the<br>ligand, these clusters trigger signaling from the cell surface and subsequently<br>are targeted to the Golgi in a lipid-raft dependent pathway. Forms the cluster<br>TLR2:TLR6:CD14:CD36 in response to diacylated lipopeptides and<br>TLR2:TLR1:CD14 in response to triacylated lipopeptides (PubMed: <u>16880211</u> ).<br>Required for normal uptake of M.tuberculosis, a process that is inhibited by<br>M.tuberculosis LppM (By similarity). |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cellular Location | Membrane {ECO:0000250 UniProtKB:Q9QUN7}; Single- pass type I<br>membrane protein. Cytoplasmic vesicle, phagosome membrane<br>{ECO:0000250 UniProtKB:Q9QUN7}; Single-pass type I membrane protein.<br>Membrane raft. Note=Does not reside in lipid rafts before stimulation but<br>accumulates increasingly in the raft upon the presence of the microbial<br>ligand. In response to diacylated lipoproteins, TLR2:TLR6 heterodimers are<br>recruited in lipid rafts, this recruitment determines the intracellular targeting<br>to the Golgi apparatus. Triacylated lipoproteins induce the same mechanism<br>for TLR2:TLR1 heterodimers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Tissue Location   | Highly expressed in peripheral blood leukocytes, in particular in monocytes,<br>in bone marrow, lymph node and in spleen. Also detected in lung and in fetal<br>liver. Levels are low in other tissues                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Background

The protein encoded by this gene is a member of the Toll-like receptor (TLR) family which plays a fundamental role in pathogen recognition and activation of innate immunity. TLRs are highly conserved from Drosophila to humans and share structural and functional similarities. They recognize pathogen-associated molecular patterns (PAMPs) that are expressed on infectious agents, and mediate the production of cytokines necessary for the development of effective immunity. The various TLRs exhibit different patterns of expression. This gene is expressed most abundantly in peripheral blood leukocytes, and mediates host response to Gram-positive bacteria and yeast via stimulation of NF-kappaB.

## Images

Flow cytometric analysis of CEM cells using TLR2 antibody(N-term)(bottom histogram) compared to a negative control cell(top histogram).

Formalin-fixed and paraffin-embedded human lung carcinoma tissue reacted with TLR2 antibody(N-term), which was peroxidase-conjugated to the secondary antibody, followed by DAB staining.

Western blot analysis of TLR2 antibody in Ramos cell line lysates.
