## Protein Information

Name	GZMB {ECO:0000303 PubMed:32188940, ECO:0000312 HGNC:HGNC:4709}
Function	Abundant protease in the cytosolic granules of cytotoxic T- cells and NK-cells which activates caspase-independent pyroptosis when delivered into the target cell through the immunological synapse (PubMed: <a href="#">1985927</a> , PubMed: <a href="#">3262682</a> , PubMed: <a href="#">3263427</a> ). It cleaves after Asp (PubMed: <a href="#">1985927</a> , PubMed: <a href="#">8258716</a> ). Once delivered into the target cell, acts by catalyzing cleavage of gasdermin-E (GSDME), releasing the pore- forming moiety of GSDME, thereby triggering pyroptosis and target cell death (PubMed: <a href="#">31953257</a> , PubMed: <a href="#">32188940</a> ). Seems to be linked to an activation cascade of caspases (aspartate-specific cysteine proteases) responsible for apoptosis execution. Cleaves caspase-3, -9 and -10 (CASP3, CASP9 and CASP10, respectively) to give rise to active enzymes mediating apoptosis (PubMed: <a href="#">9852092</a> ). Cleaves and activates CASP7 in response to bacterial infection, promoting plasma membrane repair (By similarity).
Cellular Location	Secreted. Cytolytic granule. Note=Delivered into the target cell by perforin (PubMed:20038786).
