Protein Information

Name	OVOL2 (HGNC:15804)
Synonyms	ZNF339
Function	Zinc-finger transcription repressor factor (PubMed: 19700410). Plays a critical role in maintaining the identity of epithelial lineages by suppressing epithelial-to mesenchymal transition (EMT) mainly through the repression of ZEB1, an EMT inducer (By similarity). Positively regulates neuronal differentiation (By similarity). Suppresses cell cycling and terminal differentiation of keratinocytes by directly repressing MYC and NOTCH1 (PubMed: 19700410). Important for the correct development of primordial germ cells in embryos (By similarity). Plays dual functions in thermogenesis

and adipogenesis to maintain energy balance. Essential for brown/beige adipose tissue- mediated thermogenesis, is necessary for the development of brown adipocytes. In white adipose tissues, limits adipogenesis by blocking CEBPA binding to its transcriptional targets and inhibiting its transcription factor activity (By similarity).

Cellular Location

Nucleus {ECO:0000250|UniProtKB:Q8CIV7}.

Tissue Location

Expressed in testis, ovary, heart and skeletal muscle (PubMed:12213202). Expressed in the cornea, but absent from the corneal endothelium (PubMed:26749309).
