Protein Information

Name TBX6

Function T-box transcription factor that plays an essential role in the determination of

the fate of axial stem cells: neural vs mesodermal. Acts in part by down-regulating, a specific enhancer (N1) of SOX2, to inhibit neural development. Seems to play also an essential role in left/right axis

determination and acts through effects on Notch signaling around the node as well as through an effect on the morphology and motility of the nodal cilia

(By similarity).

Cellular Location Nucleus {ECO:0000255|PROSITE-ProRule:PRU00201}.

Tissue Location Expressed in fetal tail bud, posterior spinal tissue, intervertebral disk and

testis. Also expressed in adult testis, kidney, lung, muscle and thymus
