KCNN2 antibody - C-terminal region

Rabbit Polyclonal Antibody Catalog # AI10786

Product Information

Application WB, IHC Primary Accession Q9H2S1

Other Accession NM 021614, NP 067627

Reactivity Human, Mouse, Rat, Rabbit, Zebrafish, Pig, Dog, Horse, Bovine, Yeast

Predicted Human, Mouse, Rat, Rabbit, Pig, Chicken, Dog, Horse, Bovine

Host Rabbit
Clonality Polyclonal
Calculated MW 63760

Additional Information

Gene ID 3781

Alias Symbol SK2, hSK2, SKCA2, KCa2.2

Other Names Small conductance calcium-activated potassium channel protein 2, SK2, SKCa

2, SKCa2, KCa2.2, KCNN2

Format Liquid. Purified antibody supplied in 1x PBS buffer with 0.09% (w/v) sodium

azide and 2% sucrose.

Reconstitution & Storage Add 100 ul of distilled water. Final anti-KCNN2 antibody concentration is 1

mg/ml in PBS buffer with 2% sucrose. For longer periods of storage, store at

20°C. Avoid repeat freeze-thaw cycles.

Precautions KCNN2 antibody - C-terminal region is for research use only and not for use in

diagnostic or therapeutic procedures.

Protein Information

Name KCNN2 (<u>HGNC:6291</u>)

Function Small conductance calcium-activated potassium channel that mediates the

voltage-independent transmembrane transfer of potassium across the cell membrane through a constitutive interaction with calmodulin which binds the

intracellular calcium allowing its opening (PubMed: 10991935,

PubMed:33242881, PubMed:9287325). The current is characterized by a voltage-independent activation, an intracellular calcium concentration increase-dependent activation and a single- channel conductance of about 3 picosiemens (PubMed:10991935). Also presents an inwardly rectifying current, thus reducing its already small outward conductance of potassium ions, which is particularly the case when the membrane potential displays

positive values, above + 20 mV (PubMed:10991935). The inward rectification could be due to a blockade of the outward current by intracellular divalent cations such as calcium and magnesium and could also be due to an intrinsic property of the channel pore, independent of intracellular divalent ions. There are three positively charged amino acids in the S6 transmembrane domain, close to the pore, that collectively control the conductance and rectification through an electrostatic mechanism. Additionally, electrostatic contributions from these residues also play an important role in determining the intrinsic open probability of the channel in the absence of calcium, affecting the apparent calcium affinity for activation. Forms an heteromeric complex with calmodulin, which is constitutively associated in a calcium-independent manner. Channel opening is triggered when calcium binds the calmodulin resulting in a rotary movement leading to the formation of the dimeric complex to open the gate (By similarity). Plays a role in the repolarization phase of cardiac action potential (PubMed:13679367).

Cellular Location

Membrane; Multi-pass membrane protein. Cytoplasm, myofibril, sarcomere, Z line {ECO:0000250 | UniProtKB:P58390}

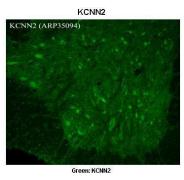

Tissue Location

Expressed in atrial myocytes (at protein level) (PubMed:13679367). Widely expressed.
