Protein Information

Name	DHX34 (HGNC:16719)
Function	Probable ATP-binding RNA helicase required for nonsense- mediated decay (NMD) degradation of mRNA transcripts containing premature stop codons (PubMed: 25220460 , PubMed: 33205750). Promotes the phosphorylation of UPF1 along with its interaction with key NMD pathway proteins UPF2 and EIF4A3 (PubMed: 25220460). Interaction with the RUVBL1-RUVBL2 complex results in loss of nucleotide binding ability and ATP hydrolysis of the complex (PubMed: 33205750). Negatively regulates the nucleotide binding ability and ATP hydrolysis of the RUVBL1-RUVBL2 complex via induction of N-terminus conformation changes of the RUVBL2 subunits (PubMed: 33205750).

Tissue Location

Expressed in whole blood, testis and spleen. Also expressed in the brain.
