Protein Information

Name	Chst11
Function	Catalyzes the transfer of sulfate to position 4 of the N- acetylgalactosamine (GalNAc) residue of chondroitin. Chondroitin sulfate constitutes the predominant proteoglycan present in cartilage and is distributed on the surfaces of many cells and extracellular matrices. Can also sulfate Gal residues in desulfated dermatan sulfate. Preferentially sulfates in GlcA->GalNAc unit than in IdoA->GalNAc unit. Does not form 4, 6-di-O-sulfated GalNAc when chondroitin sulfate C is used as an acceptor.
Cellular Location	Golgi apparatus membrane; Single- pass type II membrane protein

Tissue Location

Predominantly expressed in brain and kidney. Also expressed at weaker level in heart, spleen and lung. Expressed in developing chondrocytes.
