Protein Information

Name	POLRMT (HGNC:9200)
Function	DNA-dependent RNA polymerase catalyzes the transcription of mitochondrial DNA into RNA using the four ribonucleoside triphosphates as substrates (PubMed: 21278163 , PubMed: 33602924). Component of the mitochondrial transcription initiation complex, composed at least of TFB2M, TFAM and POLRMT that is required for basal transcription of mitochondrial DNA (PubMed: 29149603). In this complex, TFAM recruits POLRMT to a specific promoter whereas TFB2M induces structural changes in POLRMT to enable promoter opening and trapping of the DNA non- template strand (PubMed: 29149603). Has DNA primase activity (PubMed: 18685103 , PubMed: 33602924). Catalyzes the synthesis of short RNA primers that are necessary for the initiation of lagging-strand DNA synthesis from the origin of

light-strand DNA replication (OriL) (PubMed:[18685103](#), PubMed:[33602924](#)).
