Protein Information

Name	Ankrd9
Function	Substrate receptor subunit of a cullin-RING superfamily E3 ligase complex (CUL5-based E3 ubiquitin ligase complex) which mediates the ubiquitination and subsequent proteasomal degradation of target proteins. Depending of the metabolic state of the cell, promotes the proteasomal degradation of IMPDH2, the rate-limiting enzyme in GTP biosynthesis or protects IMPDH2 by stabilizing IMPDH2 filaments assembly. Implicated in different cellular processes, like copper homeostasis and cell proliferation.
Cellular Location	Cytoplasmic vesicle {ECO:0000250 UniProtKB:Q96BM1}. Cytoplasm, cytosol {ECO:0000250 UniProtKB:Q96BM1}. Note=Detected in long filamentous cytosolic structures where it colocalizes with IMPDH2. Under basal conditions

ANKRD9 is mainly in vesicle-like structures, upon nutrient limitation (guanine nucleotides deficiency) ANKRD9 loses its vesicular pattern and assembles with IMPDH2 into rodlike filaments {ECO:0000250|UniProtKB:Q96BM1}
