

HOOK1 antibody - C-terminal region

Rabbit Polyclonal Antibody Catalog # AI14770

Product Information

Application WB Primary Accession Q9UJC3

Other Accession <u>NM 015888</u>, <u>NP 056972</u>

Reactivity Human, Mouse, Rat, Rabbit, Pig, Dog, Guinea Pig, Horse, Bovine

Predicted Human, Mouse, Rat, Rabbit, Pig, Chicken, Dog, Guinea Pig, Horse, Bovine

Host Rabbit
Clonality Polyclonal
Calculated MW 84648

Additional Information

Gene ID 51361

Alias Symbol HK1, MGC10642

Other Names Protein Hook homolog 1, h-hook1, hHK1, HOOK1

Format Liquid. Purified antibody supplied in 1x PBS buffer with 0.09% (w/v) sodium

azide and 2% sucrose.

Reconstitution & Storage Add 50 ul of distilled water. Final anti-HOOK1 antibody concentration is 1

mg/ml in PBS buffer with 2% sucrose. For longer periods of storage, store at

20°C. Avoid repeat freeze-thaw cycles.

Precautions HOOK1 antibody - C-terminal region is for research use only and not for use

in diagnostic or therapeutic procedures.

Protein Information

Name HOOK1 (<u>HGNC:19884</u>)

Function Component of the FTS/Hook/FHIP complex (FHF complex)

(PubMed:<u>18799622</u>, PubMed:<u>32073997</u>). The FHF complex may function to promote vesicle trafficking and/or fusion via the homotypic vesicular protein sorting complex (the HOPS complex) (PubMed:<u>18799622</u>). FHF complex promotes the distribution of AP-4 complex to the perinuclear area of the cell (PubMed:<u>32073997</u>). Required for spermatid differentiation. Probably involved in the positioning of the microtubules of the manchette and the

flagellum in relation to the membrane skeleton (By similarity).

Cellular Location Cytoplasm. Cytoplasm, cytoskeleton. Note=Localizes to punctate cytoplasmic

foci which do not appear to overlap with early or late endosomes, the

endoplasmic reticulum, multivesicular bodies (MVBs), lysosomes, or mitochondria (By similarity). Often found in close association with microtubules (By similarity). Does not associate with the Golgi complex. During spermiogenesis, it localizes to the manchette in spermatids from steps 8-10. It is also present between the microtubule manchette and the nucleus. During manchette elongation, it is preferentially localized to the nuclear ring of the manchette, whereas the strong localization to the manchette decreases. In more mature spermatids, while the manchette migrates posteriorly, it localizes to punctuates spots. At later stages of spermatid differentiation, the punctuate expression pattern is found at both the attachment site and the proximal end of the elongated manchette. In contrast, it is not present in mature spermatozoa (By similarity) {ECO:0000250 | UniProtKB:Q8BIL5}
