Protein Information

Name	UBL5
Function	Ubiquitin-like protein that plays a role in cell proliferation and sister chromatid cohesion by associating with spliceosomal proteins (PubMed: 25092792). Participates thereby in pre- mRNA splicing by maintaining spliceosome integrity. Promotes the functional integrity of the Fanconi anemia DNA repair pathway by interacting with FANCI component

and subsequently mediating the formation of FANCI homodimers (PubMed:[25862789](#)). Also plays a protective role against ER stress-induced apoptosis (PubMed:[37315790](#)).

Cellular Location	Cytoplasm. Nucleus. Nucleus, Cajal body
Tissue Location	Ubiquitous. Highest level of expression in heart, skeletal muscle, kidney, liver, iris and lymphoblasts

Background

Ubiquitin-like proteins (UBLs) are thought to be reversible modulators of protein function rather than protein degraders like ubiquitin (MIM 191339).
