

Anti-GABAA Receptor $\alpha 6$ Antibody

Our Anti-GABAA Receptor $\alpha 6$ primary antibody from PhosphoSolutions is rabbit polyclonal. It detects m
Catalog # AN1397

Product Information

Application	WB
Primary Accession	P30191
Host	Rabbit
Clonality	Polyclonal
Isotype	IgG
Calculated MW	51184

Additional Information

Gene ID	29708
Other Names	GABA A antibody, GABA A Receptor $\alpha 6$ polypeptide antibody, GABA A receptor $\alpha 6$ antibody, GABA A receptor subunit $\alpha 6$ antibody, GABA subunit A receptor $\alpha 6$ antibody, GABA(A) receptor subunit $\alpha 6$ antibody, GABRA6 antibody, GABRA6 antibody, Gamma aminobutyric acid A receptor $\alpha 6$ antibody, Gamma aminobutyric acid GABA A receptor $\alpha 6$ antibody, Gamma aminobutyric acid receptor subunit $\alpha 6$ antibody, Gamma-aminobutyric acid receptor subunit $\alpha 6$ antibody, GBRA6_HUMAN antibody, MGC116903 antibody, MGC116904 antibody
Target/Specificity	Gamma-aminobutyric acid (GABA) is the primary inhibitory neurotransmitter in the central nervous system, causing a hyperpolarization of the membrane through the opening of a Cl^- channel associated with the GABA-A receptor (GABA-A-R) subtype. GABA-A-Rs are important therapeutic targets for a range of sedative, anxiolytic, and hypnotic agents and are implicated in several diseases including epilepsy, anxiety, depression, and substance abuse. The GABA-A-R is a multimeric subunit complex. To date six α s, four β s and four γ s, plus alternative splicing variants of some of these subunits, have been identified (Olsen and Tobin, 1990; Whiting et al., 1999; Ogris et al., 2004). Injection in oocytes or mammalian cell lines of cRNA coding for α - and β -subunits results in the expression of functional GABA-A-Rs sensitive to GABA. However, coexpression of a γ -subunit is required for benzodiazepine modulation. The various effects of the benzodiazepines in brain may also be mediated via different α - subunits of the receptor (McKernan et al., 2000; Mehta and Ticku, 1998; Ogris et al., 2004; P α tl et al., 2003).
Dilution	WB~~1:1000
Format	Antigen Affinity Purified
Storage	Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C in small aliquots to prevent freeze-thaw cycles.

Precautions

Anti-GABAA Receptor $\alpha 6$ Antibody is for research use only and not for use in diagnostic or therapeutic procedures.

Shipping

Blue Ice

Background

Gamma-aminobutyric acid (GABA) is the primary inhibitory neurotransmitter in the central nervous system, causing a hyperpolarization of the membrane through the opening of a Cl^- channel associated with the GABA-A receptor (GABA-A-R) subtype. GABA-A-Rs are important therapeutic targets for a range of sedative, anxiolytic, and hypnotic agents and are implicated in several diseases including epilepsy, anxiety, depression, and substance abuse. The GABA-A-R is a multimeric subunit complex. To date six α s, four β s and four γ s, plus alternative splicing variants of some of these subunits, have been identified (Olsen and Tobin, 1990; Whiting et al., 1999; Ogris et al., 2004). Injection in oocytes or mammalian cell lines of cRNA coding for α - and β -subunits results in the expression of functional GABA-A-Rs sensitive to GABA. However, coexpression of a γ -subunit is required for benzodiazepine modulation. The various effects of the benzodiazepines in brain may also be mediated via different α -subunits of the receptor (McKernan et al., 2000; Mehta and Ticku, 1998; Ogris et al., 2004; Pölzl et al., 2003).

Images

Western blot of mouse forebrain lysates from Wild Type (WT) and $\alpha 6$ -knockout (K/O) animals showing specific immunolabeling of the ~57 kDa $\alpha 6$ -subunit of the GABAA-R. The labeling was absent from a lysate prepared from $\alpha 6$ -knockout animals.
