

## Anti-c-Abl (Tyr-245), Phosphospecific Antibody

Catalog # AN1612

## **Product Information**

**Application WB Primary Accession** P00519 Rabbit Host

Clonality Rabbit Polyclonal

Isotype IgG Calculated MW 122873

## **Additional Information**

Gene ID

**Other Names** BCR-Abl, p150, Abelson murine leukemia viral oncogene homolog 1

Target/Specificity The c-Abl proto-oncogene encodes a nonreceptor type protein tyrosine kinase

that is widely expressed and is distributed in both the nucleus and the cytoplasm of cells. It has been implicated in regulation of cell proliferation, differentiation, apoptosis, cell adhesion, and stress response. A variety of stimuli activate c-Abl kinase including integrin activation, PDGF stimulation, and binding to proteins, such as c-Jun. Tyrosine phosphorylation is important for the regulation of c-Abl kinase activity. Tyrosine 245 is located in the linker region between the SH2 and catalytic domains. Phosphorylation of Tyr-245 is involved in activation of c-Abl kinase activity. Tyrosine 412 is located in the kinase activation loop of c-Abl, and phosphorylation of this residue is required for kinase activity. Thus, phosphorylation of Tyr-245 and Tyr-412 may be

critical for activation of c-Abl in a variety of cell signaling pathways

Dilution WB~~1:1000

**Format** Antigen Affinity Purified

Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store Storage

at -20°C in small aliquots to prevent freeze-thaw cycles.

**Precautions** Anti-c-Abl (Tyr-245), Phosphospecific Antibody is for research use only and

not for use in diagnostic or therapeutic procedures.

Shipping Blue Ice

## Background

The c-Abl proto-oncogene encodes a nonreceptor type protein tyrosine kinase that is widely expressed and is distributed in both the nucleus and the cytoplasm of cells. It has been implicated in regulation of cell proliferation, differentiation, apoptosis, cell adhesion, and stress response. A variety of stimuli activate c-Abl kinase including integrin activation, PDGF stimulation, and binding to proteins, such as c-Jun. Tyrosine

phosphorylation is important for the regulation of c-Abl kinase activity. Tyrosine 245 is located in the linker region between the SH2 and catalytic domains. Phosphorylation of Tyr-245 is involved in activation of c-Abl kinase activity. Tyrosine 412 is located in the kinase activation loop of c-Abl, and phosphorylation of this residue is required for kinase activity. Thus, phosphorylation of Tyr-245 and Tyr-412 may be critical for activation of c-Abl in a variety of cell signaling pathways
