

Anti- γ -Catenin (C-terminal region) Antibody

Catalog # AN1681

Product Information

Application	WB
Primary Accession	P14923
Host	Rabbit
Clonality	Rabbit Polyclonal
Isotype	IgG
Calculated MW	81745

Additional Information

Gene ID	3728
Other Names	Plakoglobin, JUP, Desmoplakin III, Desmoplakin-3, catenin gamma1
Target/Specificity	<p>Plakoglobin (γ-Catenin) is a catenin family member identified as a component of desmosomes. γ-Catenin has high homology to β-catenin and, like β-catenin, it can associate with the cadherins, E-cadherin and N-cadherin. One molecule of α-catenin and at least one molecule of β-catenin and γ-Catenin simultaneously bind to a single cadherin molecule. A 19-amino acid sequence of desmoglein was found to be critical for binding of γ-Catenin. Similar catenin-binding domains found in cadherins, suggest a common mechanism for γ-Catenin localization to both adherens junctions and desmosomes. Phosphorylation of tyrosine residues in γ-Catenin can modify its interactions with other proteins. Phosphorylation of tyrosine 644 decreases γ-Catenin association with α-catenin, but increases binding to desmoplakin. Fer kinase can phosphorylate tyrosine 550, which increases γ-Catenin binding to α-catenin. Thus, tyrosine phosphorylation may be important for regulation of γ-Catenin protein-protein interactions within desmosomal complexes.</p>
Dilution	WB~1:1000
Format	Antigen Affinity Purified
Storage	Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C in small aliquots to prevent freeze-thaw cycles.
Precautions	Anti- γ -Catenin (C-terminal region) Antibody is for research use only and not for use in diagnostic or therapeutic procedures.
Shipping	Blue Ice

Background

Plakoglobin (γ -Catenin) is a catenin family member identified as a component of desmosomes. γ -Catenin has high homology to β -catenin and, like β -catenin, it can associate with the cadherins, E-cadherin and N-cadherin. One molecule of α -catenin and at least one molecule of β -catenin and γ -Catenin simultaneously

bind to a single cadherin molecule. A 19-amino acid sequence of desmoglein was found to be critical for binding of γ -Catenin. Similar catenin-binding domains found in cadherins, suggest a common mechanism for γ -Catenin localization to both adherens junctions and desmosomes. Phosphorylation of tyrosine residues in γ -Catenin can modify its interactions with other proteins. Phosphorylation of tyrosine 644 decreases γ -Catenin association with α -catenin, but increases binding to desmoplakin. Fer kinase can phosphorylate tyrosine 550, which increases γ -Catenin binding to α -catenin. Thus, tyrosine phosphorylation may be important for regulation of γ -Catenin protein-protein interactions within desmosomal complexes.
