Description This gene encodes a member of the type I (acidic) cytokeratin family, which

belongs to the superfamily of intermediate filament (IF) proteins. Keratins are heteropolymeric structural proteins which form the intermediate filament. These filaments, along with actin microfilaments and microtubules, compose the cytoskeleton of epithelial cells. Mutations in this gene are associated with epidermolytic hyperkeratosis. This gene is located within a cluster of keratin

family members on chromosome 17q21.;

Immunogen Purified recombinant fragment of human KRT10 (AA: 345-454) expressed in E.

Coli.

Formulation Purified antibody in PBS with 0.05% sodium azide

Application Note ELISA: 1/10000; WB: 1/500 - 1/2000; IHC: 1/200 - 1/1000;

Protein Information

Name KRT10

Synonyms KPP

Function Plays a role in the establishment of the epidermal barrier on plantar skin (By

similarity). Involved in the maintenance of cell layer development and keratin

filament bundles in suprabasal cells of the epithelium (By similarity).

Cellular Location Secreted, extracellular space. Cell surface. Cytoplasm

Tissue Location Seen in all suprabasal cell layers including stratum corneum. Expressed on

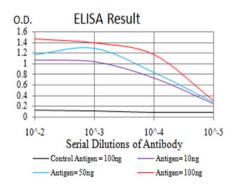

the surface of lung cell lines (PubMed:19627498). Localized on the surface of

desquamated nasal epithelial cells (at protein level) (PubMed:12427098)
