## **Additional Information**

| Gene ID     | 604  |
|-------------|--|
| Other Names | BCL5; LAZ3; BCL6A; ZNF51; ZBTB27   |
| Dilution    | WB~~ 1/500 - 1/2000 IHC~~1:100~500 ICC~~N/A E~~ 1/10000  |
| Storage     | Maintain refrigerated at 2-8°C for up to 6 months. For long term storage store at -20°C in small aliquots to prevent freeze-thaw cycles. |
| Precautions | BCL6 is for research use only and not for use in diagnostic or therapeutic procedures.   |

## **Protein Information**

| Name     | BCL6   |
|----------|--|
| Synonyms | BCL5, LAZ3, ZBTB27, ZNF51  |
| Function | Transcriptional repressor mainly required for germinal center (GC)<br>formation and antibody affinity maturation which has different mechanisms<br>of action specific to the lineage and biological functions. Forms complexes<br>with different corepressors and histone deacetylases to repress the<br>transcriptional expression of different subsets of target genes. Represses its<br>target genes by binding directly to the DNA sequence 5'-TTCCTAGAA-3'<br>(BCL6-binding site) or indirectly by repressing the transcriptional activity of |

|                   | transcription factors. In GC B-cells, represses genes that function in differentiation, inflammation, apoptosis and cell cycle control, also autoregulates its transcriptional expression and up-regulates, indirectly, the expression of some genes important for GC reactions, such as AICDA, through the repression of microRNAs expression, like miR155. An important function is to allow GC B-cells to proliferate very rapidly in response to T- cell dependent antigens and tolerate the physiological DNA breaks required for immunglobulin class switch recombination and somatic hypermutation without inducing a p53/TP53-dependent apoptotic response. In follicular helper CD4(+) T-cells (T(FH) cells), promotes the expression of T(FH)-related genes but inhibits the differentiation of T(H)1, T(H)2 and T(H)17 cells. Also required for the establishment and maintenance of immunological memory for both T- and B-cells. Suppresses macrophage proliferation through competition with STAT5 for STAT- binding motifs binding on certain target genes, such as CCL2 and CCND2. In response to genotoxic stress, controls cell cycle arrest in GC B- cells in both p53/TP53-dependedent and -independent manners. Besides, also controls neurogenesis through the alteration of the composition of NOTCH-dependent transcriptional complexes at selective NOTCH targets, such as HES5, including the recruitment of the deacetylase SIRT1 and resulting in an epigenetic silencing leading to neuronal differentiation. |
|-------------------|--|
| Cellular Location | Nucleus  |
| Tissue Location   | Expressed in germinal center T- and B-cells and in primary immature dendritic cells.   |
