

# DMP4 Antibody (C-term)

Affinity Purified Rabbit Polyclonal Antibody (Pab) Catalog # AP10983b

## **Product Information**

Application WB, IHC-P, E Primary Accession Q8IXL6

Other Accession Q5MJS3, NP 064608.2

Reactivity Human **Predicted** Mouse Host Rabbit Clonality Polyclonal Isotype Rabbit IgG **Clone Names** RB24962 66234 **Calculated MW** 443-471 **Antigen Region** 

# **Additional Information**

**Gene ID** 56975

Other Names Extracellular serine/threonine protein kinase FAM20C, Dentin matrix protein

4, DMP-4, Golgi-enriched fraction casein kinase, GEF-CK, Protein FAM20C,

FAM20C, DMP4

**Target/Specificity** This DMP4 antibody is generated from rabbits immunized with a KLH

conjugated synthetic peptide between 443-471 amino acids from the

C-terminal region of human DMP4.

**Dilution** WB~~1:1000 IHC-P~~1:100~500 E~~Use at an assay dependent concentration.

**Format** Purified polyclonal antibody supplied in PBS with 0.09% (W/V) sodium azide.

This antibody is purified through a protein A column, followed by peptide

affinity purification.

**Storage** Maintain refrigerated at 2-8°C for up to 2 weeks. For long term storage store

at -20°C in small aliquots to prevent freeze-thaw cycles.

**Precautions** DMP4 Antibody (C-term) is for research use only and not for use in diagnostic

or therapeutic procedures.

## **Protein Information**

Name FAM20C ( HGNC:22140)

**Function** Golgi serine/threonine protein kinase that phosphorylates secretory

pathway proteins within Ser-x-Glu/pSer motifs and plays a key role in biomineralization of bones and teeth (PubMed: 22582013, PubMed: 23754375, PubMed: <u>25789606</u>). Constitutes the main protein kinase for extracellular proteins, generating the majority of the extracellular phosphoproteome (PubMed:26091039). Mainly phosphorylates proteins within the Ser-x-Glu/pSer motif, but also displays a broader substrate specificity (PubMed: 26091039). Phosphorylates ERO1A, enhancing its activity which is required to maintain endoplasmic reticulum redox homeostasis and for oxidative protein folding (PubMed: 29858230, PubMed: 34349020). During endoplasmic reticulum stress, phosphorylates P4HB/PDIA1 which induces a functional switch, causing P4HB to change from an oxidoreductase to a molecular chaperone (PubMed:32149426). This is critical to maintain ER proteostasis and reduce cell death under ER stress (PubMed:32149426). Phosphorylation of P4HB also promotes its interaction with ERN1, leading to reduced activity of ERN1, a key sensor for the endoplasmic reticulum unfolded protein response (PubMed:32149426). Required for osteoblast differentiation and mineralization (PubMed:34349020). Phosphorylates casein as well as a number of proteins involved in biomineralization such as AMELX, AMTN, ENAM and SPP1/OPN (PubMed:22582013, PubMed:25789606, PubMed:34349020). In addition to its role in biomineralization, also plays a role in lipid homeostasis, wound healing and cell migration and adhesion (PubMed:26091039).

#### **Cellular Location**

Golgi apparatus membrane; Single-pass type II membrane protein. Secreted. Endoplasmic reticulum. Note=Resides in the Golgi apparatus membrane and is secreted following propeptide cleavage (PubMed:34349020). Retained in the endoplasmic reticulum (ER) in response to ER stress where it phosphorylates P4HB (PubMed:32149426)

**Tissue Location** 

Widely expressed..

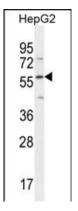

# **Background**

Calcium-binding protein which may play a role in dentin mineralization (By similarity).
