

alpha smooth muscle Actin Rabbit pAb

alpha smooth muscle Actin Rabbit pAb Catalog # AP50857

Product Information

Application WB, IHC-P, IHC-F, IF

Primary Accession P62736

Reactivity Human, Mouse, Rat

Predicted Rabbit
Host Rabbit
Clonality Polyclonal
Calculated MW 42009
Physical State Liquid

Immunogen KLH conjugated synthetic peptide derived from human Actin alpha

Epitope Specificity 301-375/375

Isotype IgG

Purity affinity purified by Protein A

Buffer 0.01M TBS (pH7.4) with 1% BSA, 0.02% Proclin300 and 50% Glycerol.

SUBCELLULAR LOCATION Cytoplasm, cytoskeleton. SIMILARITY Belongs to the actin family.

SUBUNIT Polymerization of globular actin (G-actin) leads to a structural filament

(F-actin) in the form of a two-stranded helix. Each actin can bind to 4 others.

Post-translational Oxidation of Met-46 by MICAL3 (MICAL1, MICAL2 or MICAL3) to form

modifications methionine sulfoxide promotes actin filament depolymerization. Methionine

sulfoxide is produced stereospecifically, but it is not known whether the

(S)-S-oxide or the (R)-S-oxide is produced (By similarity).

DISEASEDefects in ACTA2 are the cause of aortic aneurysm familial thoracic type 6

(AAT6) [MIM:611788]. AATs are characterized by permanent dilation of the thoracic aorta usually due to degenerative changes in the aortic wall. They are primarily associated with a characteristic histologic appearance known as 'medial necrosis' or 'Erdheim cystic medial necrosis' in which there is

degeneration and fragmentation of elastic fibers, loss of smooth muscle cells,

and an accumulation of basophilic ground substance.

Important Note This product as supplied is intended for research use only, not for use in

human, therapeutic or diagnostic applications.

Background Descriptions All eukaryotic cells express Actin, which often constitutes as much as 50% of

total cellular protein. Actin filaments can form both stable and labile structures and are crucial components of microvilli and the contractile apparatus of muscle cells. While lower eukaryotes, such as yeast, have only one Actin gene, higher eukaryotes have several isoforms encoded by a family of genes. At least six types of Actin are present in mammalian tissues and fall into three classes. alpha-Actin expression is limited to various types of muscle, whereas beta- and gamma-Actin are the principle constituents of filaments in other tissues. Members of the small GTPase family regulate the organization of the Actin cytoskeleton. Rho controls the assembly of Actin stress fibers and focal adhesion. Rac regulates Actin filament accumulation at the plasma membrane. Cdc42 stimulates formation of filopodia.

Additional Information

Gene ID 59

Other Names Actin, aortic smooth muscle, 3.6.4.-, Alpha-actin-2, Cell growth-inhibiting gene

46 protein, Actin, aortic smooth muscle, intermediate form, ACTA2, ACTSA,

ACTVS

Dilution WB=1:1000-5000,IHC-P=1:100-500,IHC-F=1:100-500,IF=1:100-500,Flow-Cyt=1

□g/Test

Storage Store at -20 °C for one year. Avoid repeated freeze/thaw cycles. When

reconstituted in sterile pH 7.4 0.01M PBS or diluent of antibody the antibody

is stable for at least two weeks at 2-4 °C.

Protein Information

Name ACTA2

Synonyms ACTSA, ACTVS

Function Actins are highly conserved proteins that are involved in various types of cell

motility and are ubiquitously expressed in all eukaryotic cells.

Cellular Location Cytoplasm, cytoskeleton.

Background

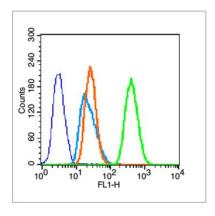

All eukaryotic cells express Actin, which often constitutes as much as 50% of total cellular protein. Actin filaments can form both stable and labile structures and are crucial components of microvilli and the contractile apparatus of muscle cells. While lower eukaryotes, such as yeast, have only one Actin gene, higher eukaryotes have several isoforms encoded by a family of genes. At least six types of Actin are present in mammalian tissues and fall into three classes. alpha-Actin expression is limited to various types of muscle, whereas beta- and gamma-Actin are the principle constituents of filaments in other tissues. Members of the small GTPase family regulate the organization of the Actin cytoskeleton. Rho controls the assembly of Actin stress fibers and focal adhesion. Rac regulates Actin filament accumulation at the plasma membrane. Cdc42 stimulates formation of filopodia.

Blank control (blue line): Hela (fixed with 70% ethanol (Overnight at 4°C) and then permeabilized with 90% ice-cold methanol for 30 min on ice).

Isotype Control Antibody (orange line): Rabbit IgG . Secondary Antibody (white blue line): Goat anti-rabbit IgG-FITC,Dilution: 1 µg /test.

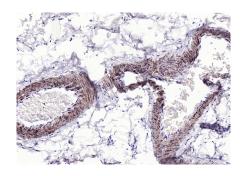

Sample:

A549(Human) Cell Lysate at 30 ug
NIH/3T3(Mouse) Cell Lysate at 30 ug
Hela(Human) Cell Lysate at 30 ug
A431(Human) Cell Lysate at 30 ug
HepG2(Human) Cell Lysate at 30 ug
Stomach (Mouse) Lysate at 40 ug
Lung (Mouse) Lysate at 40 ug
Skeletal muscle(-) (Mouse) Lysate at 40 ug
Primary: Anti-alpha smooth muscle Actin (AP50857) at
1/1000 dilution
Secondary: IRDye800CW Goat Anti-Rabbit IgG at 1/2006

Secondary: IRDye800CW Goat Anti-Rabbit IgG at 1/20000 dilution

Predicted band size: 42 kD Observed band size: 42 kD

Paraformaldehyde-fixed, paraffin embedded Human Duodenum; Antigen retrieval by boiling in sodium citrate buffer (pH6.0) for 15 min; Antibody incubation with alpha smooth muscle Actin Polyclonal Antibody, Unconjugated (AP50857) at 1:200 overnight at 4°C, followed by conjugation to the SP Kit (Rabbit, SP-0023) and DAB (C-0010) staining.

Please note: All products are 'FOR RESEARCH USE ONLY. NOT FOR USE IN DIAGNOSTIC OR THERAPEUTIC PROCEDURES'.
