## Protein Information

Name	PLSCR4 ( <a href="#">HGNC:16497</a> )
Function	Catalyzes metal ion-induced ATP-independent rapid bidirectional and non-specific movement of phospholipids (lipid scrambling or lipid flip-flop) between the inner and outer leaflet of the plasma membrane and participates in the redistribution of phospholipids between membrane leaflets (PubMed: <a href="#">23089641</a> ). Metal ions bind to the calcium-binding site and induce conformation change in the protein (PubMed: <a href="#">23089641</a> ). Has a greater affinity for Ca(2+) than Mg(2+) and Zn(2+) (PubMed: <a href="#">23089641</a> ).
Cellular Location	Cell membrane; Single-pass type II membrane protein {ECO:0000250 UniProtKB:O15162} Cell membrane; Lipid-anchor; Cytoplasmic side {ECO:0000250 UniProtKB:O15162}. Nucleus Note=Palmitoylation regulates its localization to the cell membrane or the nucleus; trafficking to the cell membrane is dependent upon palmitoylation whereas in the absence of palmitoylation, localizes to the nucleus.
Tissue Location	Expressed in heart, brain, placenta, lung, liver, kidney, pancreas, spleen,

thymus, prostate, testis, uterus, small intestine and colon. Not detected in peripheral blood lymphocytes
