Background Descriptions Chromosome 17 makes up over 2.5% of the human genome with about 81

million bases encoding over 1,200 genes. Two key tumor suppressor genes are associated with chromosome 17, namely, p53 and BRCA1. Tumor suppressor p53 is necessary for maintenance of cellular genetic integrity by moderating cell fate through DNA repair versus cell death. Malfunction or loss of p53 expression is associated with malignant cell growth and Li-Fraumeni syndrome. Like p53, BRCA1 is directly involved in DNA repair, though specifically it is recognized as a genetic determinant of early onset breast cancer and predisposition to cancers of the ovary, colon, prostate gland and fallopian tubes. Chromosome 17 is also linked to neurofibromatosis, a condition characterized by neural and epidermal lesions, and dysregulated Schwann cell growth. Alexander disease, Birt-Hogg-Dube syndrome and Canavan disease are also associated with chromosome 17. The FAM83G gene

product has been provisionally designated FAM83G pending further

characterization.

Protein Information

Name FAM83G

Synonyms PAWS1 {ECO:0000303 | PubMed:24554596}

Function Substrate for type I BMP receptor kinase involved in regulation of some

target genes of the BMP signaling pathway. Also regulates the expression of several non-BMP target genes, suggesting a role in other signaling pathways.

Cellular Location Cytoplasm, cytosol. Nucleus Note=Detected predominantly in the cytosol.

Upon BMP stimulation, a small portion localizes the nucleus.
