Background Descriptions	KIAA1751 is a 762 amino acid uncharacterized protein. Existing as three alternatively spliced isoforms, KIAA1751 is encoded by a gene that maps to human chromosome 1p36.33. Chromosome 1 spans 260 million base pairs, contains over 3,000 genes and comprises nearly 8% of the human genome. Chromosome 1 houses a large number of disease-associated genes, including those that are involved in familial adenomatous polyposis, Stickler syndrome, Parkinson's disease, Gaucher disease, schizophrenia and Usher syndrome. Aberrations in chromosome 1 are found in a variety of cancers, including head and neck cancer, malignant melanoma and multiple myeloma.
