SUBCELLULAR LOCATION	Cytoplasm, cytoskeleton. Cytoplasm, cytoskeleton, spindle. Cell junction, gap junction. Note=Colocalizes with acetylated alpha-tubulin, gamma-tubulin and F-actin. Also observed in a ring around gamma-tubulin containing centrioles possibly in the microtubule organizing center.
SIMILARITY	Belongs to the cytospin-A family. Contains 1 CH (calponin-homology) domain.
SUBUNIT	May interact with both microtubules and actin cytoskeleton.
DISEASE	Defects in SPECC1L are the cause of facial clefting oblique type 1 (OBLFC1) [MIM:600251]. A rare form of facial clefting. A facial cleft is any of the fissures between the embryonic prominences that normally unite to form the face.
Important Note	This product as supplied is intended for research use only, not for use in human, therapeutic or diagnostic applications.
Background Descriptions	This gene encodes a coiled-coil domain containing protein. The encoded protein may play a critical role in actin-cytoskeletal reorganization during facial morphogenesis. Mutations in this gene are a cause of oblique facial clefting-1. Alternatively spliced transcript variants encoding multiple isoforms have been observed for this gene. A read-through transcript composed of SPECC1L (sperm antigen with calponin homology and coiled-coil domains 1-like) and the downstream ADORA2A (adenosine A2a receptor) gene sequence has been identified, but it is thought to be non-coding.
