Background Descriptions	TSPAN17 belongs to the tetraspanin (TM4SF) family. Most of these members are cell-surface proteins that are characterized by the presence of four hydrophobic domains. The proteins mediate signal transduction events that play a role in the regulation of cell development, activation, growth and motility. There are four named isoforms.

Protein Information

Name	TSPAN17 (HGNC:13594)

Synonyms	FBXO23, TM4SF17
Function	Part of TspanC8 subgroup, composed of 6 members that interact with the transmembrane metalloprotease ADAM10. This interaction is required for ADAM10 exit from the endoplasmic reticulum and for enzymatic maturation and trafficking to the cell surface as well as substrate specificity. Different TspanC8/ADAM10 complexes have distinct substrates (PubMed:28600292, PubMed:37516108). Seems to regulate VE- cadherin expression in endothelial cells probably through interaction with ADAM10, promoting leukocyte transmigration (PubMed:28600292).
Cellular Location	Cell membrane {ECO:0000250|UniProtKB:Q9D7W4}; Multi-pass membrane protein
