#### **Protein Information**

Name H4C1

Synonyms H4/A, H4FA, HIST1H4A

**Function** Core component of nucleosome. Nucleosomes wrap and compact DNA into

chromatin, limiting DNA accessibility to the cellular machineries which require DNA as a template. Histones thereby play a central role in transcription regulation, DNA repair, DNA replication and chromosomal stability. DNA accessibility is regulated via a complex set of post-translational modifications

of histones, also called histone code, and nucleosome remodeling.

Cellular Location Nucleus {ECO:0000250 | UniProtKB:P62806}. Chromosome. Note=Localized to

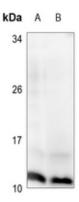

the nucleus when acetylated in step 11 spermatids.

## **Background**

KLH-conjugated synthetic peptide encompassing a sequence within the center region of human Histone H4 (pS47). The exact sequence is proprietary.

### **Images**

Western blot analysis of Histone H4 (pS47) expression in HEK293T (A), U2OS (B) whole cell lysates.

Immunofluorescent analysis of Histone H4 (pS47) staining in HeLa cells. Formalin-fixed cells were permeabilized with 0.1% Triton X-100 in TBS for 5-10 minutes and blocked with 3% BSA-PBS for 30 minutes at room temperature. Cells were probed with the primary antibody in 3% BSA-PBS and incubated overnight at 4 °C in a humidified chamber. Cells were washed with PBST and incubated with a DyLight 594-conjugated secondary antibody (red) in PBS at room temperature in the dark.
