Protein Information

Name HBP1

Function Transcriptional repressor that binds to the promoter region of target genes.

Plays a role in the regulation of the cell cycle and of the Wnt pathway. Binds preferentially to the sequence 5'- TTCATTCATTCA-3'. Binding to the histone H1.0 promoter is enhanced by interaction with RB1. Disrupts the interaction

between DNA and TCF4.

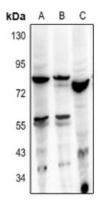

Cellular Location Nucleus {ECO:0000255 | PROSITE-ProRule:PRU00267,

ECO:0000269 | PubMed:10562551}

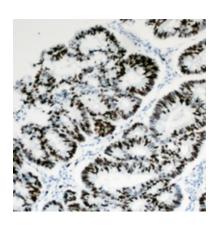

Background

KLH-conjugated synthetic peptide encompassing a sequence within the C-term region of human HBP1. The exact sequence is proprietary.

Images

Western blot analysis of HBP1 expression in A375 (A), MCF7 (B), PC12 (C) whole cell lysates.

Immunohistochemical analysis of HBP1 staining in human colon cancer formalin fixed paraffin embedded tissue section. The section was pre-treated using heat mediated antigen retrieval with sodium citrate buffer (pH 6.0). The section was then incubated with the antibody at room temperature and detected using an HRP conjugated compact polymer system. DAB was used as the chromogen. The section was then counterstained with haematoxylin and mounted with DPX.
