Protein Information

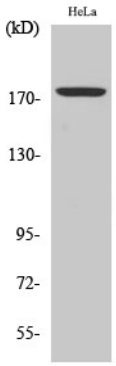

Name	ERBIN {ECO:0000303|PubMed:10878805}
Function	Acts as an adapter for the receptor ERBB2, in epithelia. By binding the unphosphorylated 'Tyr-1248' of receptor ERBB2, it may contribute to stabilize this unphosphorylated state (PubMed:16203728). Inhibits NOD2-dependent NF-kappa-B signaling and pro-inflammatory cytokine secretion (PubMed:16203728). Acts as a mediator of keratinocyte differentiation by sequestering SHOC2 away from ERK- activating RAS complexes (PubMed:23524970).
Cellular Location	Cell junction, hemidesmosome. Nucleus membrane. Basolateral cell membrane. Cytoplasm Cell membrane. Note=Found in hemidesmosomes, which are cell-substrate adhesion complexes in stratified epithelia. In transfected cells, either diffusely distributed over the cytoplasm or concentrated at the basolateral membrane. Colocalizes with the adrenergic receptors, ADREN1A and ADREN1B, at the nuclear membrane of cardiac myocytes (By similarity)
Tissue Location	Highly expressed in brain, heart, kidney, muscle and stomach, followed by

liver, spleen and intestine
