Protein Information

Name ANXA2

Synonyms ANX2, ANX2L4, CAL1H, LPC2D

Function Calcium-regulated membrane-binding protein whose affinity for calcium is

greatly enhanced by anionic phospholipids. It binds two calcium ions with

high affinity. May be involved in heat-stress response. Inhibits

PCSK9-enhanced LDLR degradation, probably reduces PCSK9 protein levels via a translational mechanism but also competes with LDLR for binding with PCSK9 (PubMed:18799458, PubMed:22848640, PubMed:24808179). Binds to endosomes damaged by phagocytosis of particulate wear debris and participates in endosomal membrane stabilization, thereby limiting NLRP3 inflammasome activation (By similarity). Required for endothelial cell surface

plasmin generation and may support fibrinolytic surveillance and

neoangiogenesis (By similarity).

Cellular Location Secreted, extracellular space, extracellular matrix, basement membrane.

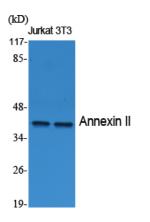

Melanosome. Note=In the lamina beneath the plasma membrane. Identified

by mass spectrometry in melanosome fractions from stage I to stage IV. Translocated from the cytoplasm to the cell surface through a Golgi-independent mechanism
