Protein Information

Name NKX3-1 (<u>HGNC:7838</u>)

Function Transcription factor, which binds preferentially the consensus sequence

5'-TAAGT[AG]-3' and can behave as a transcriptional repressor. Plays an important role in normal prostate development, regulating proliferation of glandular epithelium and in the formation of ducts in prostate. Acts as a tumor suppressor controlling prostate carcinogenesis, as shown by the ability to inhibit proliferation and invasion activities of PC-3 prostate cancer cells.

Cellular Location Nucleus {ECO:0000255 | PROSITE-ProRule:PRU00108,

ECO:0000269 | PubMed:11137288}

Tissue Location Highly expressed in the prostate and, at a lower level, in the testis.
