## Protein Information

Name	SPTLC1
Synonyms	LCB1
Function	Component of the serine palmitoyltransferase multisubunit enzyme (SPT) that catalyzes the initial and rate-limiting step in sphingolipid biosynthesis by condensing L-serine and activated acyl-CoA (most commonly palmitoyl-CoA) to form long-chain bases. The SPT complex is also composed of SPTLC2 or SPTLC3 and SPTSSA or SPTSSB. Within this complex, the heterodimer with SPTLC2 or SPTLC3 forms the catalytic core (PubMed: <a href="#">19416851</a> , PubMed: <a href="#">33558762</a> , PubMed: <a href="#">36170811</a> ). The composition of the serine palmitoyltransferase (SPT) complex determines the substrate preference (PubMed: <a href="#">19416851</a> , PubMed: <a href="#">33558762</a> ). The SPTLC1-SPTLC2-SPTSSA complex shows a strong preference for C16-CoA substrate, while the SPTLC1-SPTLC3-SPTSSA isozyme uses both C14-CoA and C16-CoA as substrates, with a slight preference for C14-CoA (PubMed: <a href="#">19416851</a> , PubMed: <a href="#">19648650</a> ). The SPTLC1-SPTLC2-SPTSSB complex shows a strong

preference for C18-CoA substrate, while the SPTLC1-SPTLC3-SPTSSB isozyme displays an ability to use a broader range of acyl-CoAs, without apparent preference (PubMed:[19416851](#), PubMed:[19648650](#), PubMed:[33558761](#), PubMed:[33558762](#)). Required for adipocyte cell viability and metabolic homeostasis (By similarity).

#### Cellular Location

Endoplasmic reticulum membrane; Single-pass membrane protein {ECO:0000250|UniProtKB:O35704}

#### Tissue Location

Widely expressed. Not detected in small intestine.
