Protein Information

Name	VGF
Function	[Neurosecretory protein VGF]: Secreted polypeptide that is packaged and proteolytically processed by prohormone convertases PCSK1 and PCSK2 in a cell-type-specific manner (By similarity). VGF and peptides derived from its processing play many roles in neurogenesis and neuroplasticity associated with learning, memory, depression and chronic pain (By similarity).
Cellular Location	[Neurosecretory protein VGF]: Secreted. Cytoplasmic vesicle, secretory vesicle. Note=Stored in secretory vesicles and then secreted, NERP peptides colocalize with vasopressin in the storage granules of hypothalamus
Tissue Location	Central and peripheral nervous systems, synthesized exclusively in neuronal and neuroendocrine cells

Background

May be involved in the regulation of cell-cell interactions or in synaptogenesis during the maturation of the nervous system.
