Protein Information

Name YWHAQ

Function Adapter protein implicated in the regulation of a large spectrum of both

general and specialized signaling pathways. Binds to a large number of partners, usually by recognition of a phosphoserine or phosphothreonine motif. Binding generally results in the modulation of the activity of the binding partner. Negatively regulates the kinase activity of PDPK1.

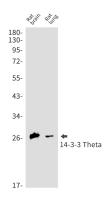

Cellular Location Cytoplasm. Note=In neurons, axonally transported to the nerve terminals

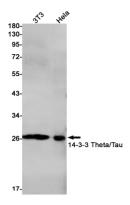

Tissue Location Abundantly expressed in brain, heart and pancreas, and at lower levels in

kidney and placenta. Up-regulated in the lumbar spinal cord from patients with sporadic amyotrophic lateral sclerosis (ALS) compared with controls, with highest levels of expression in individuals with predominant lower motor

neuron involvement
