## Protein Information

| | |
|---|---|
| **Name** | ENSA |
| **Function** | Protein phosphatase inhibitor that specifically inhibits protein phosphatase 2A (PP2A) during mitosis. When phosphorylated at Ser-67 during mitosis, specifically interacts with PPP2R2D (PR55-delta) and inhibits its activity, leading to inactivation of PP2A, an essential condition to keep cyclin-B1-CDK1 activity high during M phase (By similarity). Also acts as a stimulator of insulin secretion by interacting with sulfonylurea receptor (ABCC8), thereby preventing sulfonylurea from binding to its receptor and reducing K(ATP) channel currents. |
| **Cellular Location** | Cytoplasm. |
| **Tissue Location** | Widely expressed with high levels in skeletal muscle and brain and lower levels in the pancreas |
