

Desmin Antibody

Rabbit mAb Catalog # AP90265

Product Information

Application WB, IHC, IF, ICC, IHF

Primary Accession P17661

Reactivity Rat, Human, Mouse

Clonality Monoclonal

Other Names CMD1I; CSM1; CSM2; DES; DESM; Desmin; intermediate filament protein

IsotypeRabbit IgGHostRabbitCalculated MW53536

Additional Information

Dilution WB: 1:10000~1:20000 IHC: 1:100~1:500 ICC/IF: 1:50~1:100

Purification Affinity-chromatography

Immunogen A synthesized peptide derived from human Desmin

Description Desmin a class-III intermediate filaments found in muscle cells. In adult

striated muscle they form a fibrous network connecting myofibrils to each other and to the plasma membrane from the periphery of the Z-line structures. Mutations in this gene are associated with desmin-related myopathy, a familial cardiac and skeletal myopathy (CSM), and with distal

myopathies.

Storage Condition and Buffer Rabbit IgG in phosphate buffered saline , pH 7.4, 150mM NaCl, 0.02% sodium

azide and 50% glycerol. Store at +4°C short term. Store at -20°C long term.

Avoid freeze / thaw cycle.

Protein Information

Name DES

Function Muscle-specific type III intermediate filament essential for proper muscular

structure and function. Plays a crucial role in maintaining the structure of sarcomeres, inter-connecting the Z-disks and forming the myofibrils, linking them not only to the sarcolemmal cytoskeleton, but also to the nucleus and mitochondria, thus providing strength for the muscle fiber during activity (PubMed:25358400). In adult striated muscle they form a fibrous network connecting myofibrils to each other and to the plasma membrane from the periphery of the Z- line structures (PubMed:24200904, PubMed:25394388, PubMed:26724190). May act as a sarcomeric microtubule-anchoring protein: specifically associates with detyrosinated tubulin-alpha chains, leading to buckled microtubules and mechanical resistance to contraction. Required for nuclear membrane integrity, via anchoring at the cell tip and nuclear envelope, resulting in maintenance of microtubule-derived intracellular

mechanical forces (By similarity). Contributes to the transcriptional regulation of the NKX2-5 gene in cardiac progenitor cells during a short period of cardiomyogenesis and in cardiac side population stem cells in the adult. Plays a role in maintaining an optimal conformation of nebulette (NEB) on heart muscle sarcomeres to bind and recruit cardiac alpha-actin (By similarity).

Cellular Location

Cytoplasm, myofibril, sarcomere, Z line. Cytoplasm Cell membrane, sarcolemma. Nucleus {ECO:0000250 | UniProtKB:P31001}. Cell tip {ECO:0000250 | UniProtKB:P31001}. Nucleus envelope {ECO:0000250 | UniProtKB:P31001}. Note=Localizes in the intercalated disks which occur at the Z line of cardiomyocytes (PubMed:24200904, PubMed:26724190). Localizes in the nucleus exclusively in differentiating cardiac progenitor cells and premature cardiomyocytes (By similarity). PKP2 is required for correct anchoring of DES at the cell tip and nuclear envelope (By similarity) {ECO:0000250 | UniProtKB:P31001, ECO:0000269 | PubMed:24200904, ECO:0000269 | PubMed:26724190}
