#### **Protein Information**

Name GDNF

**Function** Neurotrophic factor that enhances survival and morphological

differentiation of dopaminergic neurons and increases their high- affinity dopamine uptake (PubMed:8493557). Acts by binding to its coreceptor, GFRA1, leading to autophosphorylation and activation of the RET receptor (PubMed:10829012, PubMed:25242331, PubMed:31535977). Involved in the

development of the neural crest (PubMed: 15242795).

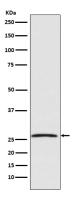

Cellular Location Secreted

**Tissue Location** In the brain, predominantly expressed in the striatum with highest levels in

the caudate and lowest in the putamen Isoform 2 is absent from most tissues except for low levels in intestine and kidney. Highest expression of isoform 3 is found in pancreatic islets. Isoform 5 is expressed at very low levels in putamen, nucleus accumbens, prefrontal cortex, amygdala, hypothalamus and intestine. Isoform 3 is up-regulated in the middle temporal gyrus of

Alzheimer disease patients while isoform 2 shows no change
