Protein Information

Name	EIF2B5
Synonyms	EIF2BE
Function	Acts as a component of the translation initiation factor 2B (eIF2B) complex, which catalyzes the exchange of GDP for GTP on eukaryotic initiation factor 2 (eIF2) gamma subunit (PubMed: 25858979 , PubMed: 27023709 , PubMed: 31048492). Its guanine nucleotide exchange factor activity is repressed when bound to eIF2 complex phosphorylated on the alpha subunit, thereby limiting the amount of methionyl- initiator methionine tRNA available to the ribosome and consequently global translation is repressed (PubMed: 25858979 , PubMed: 31048492).
Cellular Location	Cytoplasm, cytosol {ECO:0000250 UniProtKB:P56287}
