| <b>Background Descriptions</b> | KIAA1609 is a 456 amino acid protein that contains one TLD domain and is encoded by a gene that maps to human chromosome 16q24.1. Chromosome 16 encodes over 900 genes in approximately 90 million base pairs, makes up nearly 3% of human cellular DNA and is associated with a variety of genetic disorders. The GAN gene is located on chromosome 16 and, with mutation, may lead to giant axonal neuropathy, a nervous system disorder characterized by increasing malfunction with growth. The rare disorder Rubinstein-Taybi syndrome is also associated with chromosome 16, though through the CREBBP gene which encodes a critical CREB binding protein. Signs of Rubinstein-Taybi include mental retardation and predisposition to tumor growth and white blood cell neoplasias. Crohn's disease is a gastrointestinal inflammatory condition associated with chromosome 16 through the NOD2 gene. An association with systemic lupus erythematosus and a number of other autoimmune disorders with the pericentromeric region of chromosome 16 has led to the identification of SLC5A11 as a potential autoimmune modifier. |

| <b>Function</b>          | Activates an alternative mTOR signaling pathway through RPS6KB2 activation and EIF4EBP1 repression to regulate cell proliferation and migration (PubMed: <a href="#">29750193</a> ). Recruits MTOR at the lysosome, essential for MTOR signaling at the lysosome (PubMed: <a href="#">29750193</a> ). Binds to the vacuolar-type ATPase (V-ATPase) complex, triggering a conformational change and is likely to regulate its activity (PubMed: <a href="#">35672408</a> , PubMed: <a href="#">35994636</a> ). No effect on V-ATPase activity was observed in vitro in one study although it was suggested that it may have inhibitory activity in vivo (PubMed: <a href="#">35672408</a> ). However, another study showed that it can promote V-ATPase activity (PubMed: <a href="#">38593795</a> ). Protects neuronal cells against oxidative stress (By similarity). |
