ICAD Antibody

Catalog # ASC10034

Product Information

Application	WB, IF, E, IHC-P
Primary Accession	O54786
Other Accession	O54786, 9087146
Reactivity	Mouse
Host	Rabbit
Clonality	Polyclonal
Isotype	IgG
Calculated MW	36572
Conjugate	Unconjugated
Application Notes	ICAD antibody can be used for detection of of ICAD by Western blot at 1 g/mL. A 45 kDa band can be detected. Antibody can also be used for immunohistochemistry starting at 2 g/mL. For immunofluorescence start at 10 g/mL.

Additional Information

Gene ID	13347
Other Names	ICAD Antibody: ICAD, DFF35, Dff45, ICAD-L, ICAD-S, A330085O09Rik, Icad, DNA fragmentation factor subunit alpha, DNA fragmentation factor 45 kDa subunit, DFF-45, DNA fragmentation factor, alpha subunit
Target/Specificity	Dffa;
Reconstitution & Storage	ICAD antibody can be stored at 4℃ for three months and -20℃, stable for up to one year. As with all antibodies care should be taken to avoid repeated freeze thaw cycles. Antibodies should not be exposed to prolonged high temperatures.
Precautions	ICAD Antibody is for research use only and not for use in diagnostic or therapeutic procedures.

Protein Information

Name	Dffa
Synonyms	Icad
Function	Inhibitor of the caspase-activated DNase (DFF40).
Cellular Location	Cytoplasm.

Background

ICAD Antibody: Apoptosis is related to many diseases and induced by a family of cell death receptors and their ligands. Cell death signals are transduced by death domain containing adapter molecules and members of the caspase family of proteases. These death signals finally cause the degradation of chromosomal DNA by activated DNase. A human DNA fragmentation factor (DFF) was identified recently which is cleaved by caspase-3 during apoptosis. Mouse homologue of human DFF was identified as a DNase inhibitor designated ICAD, for inhibitor of caspase-activated DNase. Upon cleavage of DFF/ICAD, a caspase activated deoxyribonuclease (CAD) is released and activated and eventually causes the degradation of DNA in the nuclei. Therefore, the cleavage of CAD inhibitor molecule DFF/ICAD, which causes DNase activation and DNA degradation, is the hallmark of apoptotic cell death.
