

GH

Catalog # PVGS1017

Product Information

Primary Accession P06880
Species Mouse

Sequence Phe27-Phe216

Purity > 95% as analyzed by SDS-PAGE

> 95% as analyzed by SEC-HPLC

Endotoxin Level

Biological Activity Recombinant mouse growth hormone is fully biologically active when

compared to standard human growth hormone which is 3.0 units/mg.

Expression System E. coli

Theoretical Molecular Weight 22 kDa

Formulation Lyophilized after extensive dialysis against 50 mM Tris-HCl, pH 8.0, 500 mM

NaCl buffer.

Reconstitution It is recommended that this vial be briefly centrifuged prior to opening to

bring the contents to the bottom. Reconstitute the lyophilized powder in

sterile 18 M Ω -cm H₂O up to 100 \Box g/ml.

Storage & Stability Upon receiving, this product remains stable for up to 6 months at -70°C or

-20°C. Upon reconstitution, the product should be stable for up to 1 week at

4°C or up to 3 months at -20°C. Avoid repeated freeze-thaw cycles.

Additional Information

Gene ID 14599

Other Names Somatotropin, Growth hormone, Gh1, Gh

Target Background Growth Hormone (GH), is a member of the somatotropin / prolactin family of

hormones which play an important role in growth control. The gene, along with four other related genes, is located at the growth hormone locus on chromosome 17 where they are interspersed in the same transcriptional orientation; an arrangement which is thought to have evolved by a series of gene duplications. The five genes share a remarkably high degree of sequence identity. Alternative splicing generates additional isoforms of each of the five growth hormones, leading to further diversity and potential for specialization.

This particular family member is expressed in the pituitary but not in placental tissue as is the case for the other four genes in the growth hormone

locus. Mutations in or deletions of the gene lead to growth hormone

deficiency and short stature.

Protein Information

Name Gh1

Synonyms Gh

Function Plays an important role in growth control. Its major role in stimulating body

growth is to stimulate the liver and other tissues to secrete IGF1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and protein synthesis in muscle and other tissues.

Cellular Location Secreted.
