Additional Information

Target BackgroundMesothelin, also known as MSLN, is encoded by the MSLN gene. It encodes a
precursor protein of 71 kDa that is processed to a 31 kDa shed protein called
megakaryocyte potentiating factor (MPF) and a 40 kDa fragment, mesothelin.
MSLN is attached to the cell membrane by a glycosyl-phosphatidylinositol
(GPI) anchor. It is a differentiation antigen which is highly expressed in
several human cancers, including virtually all mesotheliomas and pancreatic
adenocarcinomas.
